DETAILED ACTION

The following is an examiner's statement of reasons for allowance:

Claim 1 is allowable over the prior art of record because the teachings of the references taken as a whole do not show or render obvious the combination set forth, including: (1) a method for sorting and recovering fine particles that are responsive to optical pressure comprising; using an apparatus for recovering the fine particles comprising a laser beam emitter that has two or more emitting apertures and a collector that has two or more chambers corresponding in number to the number of emitting apertures, emitting each laser beam from the laser beam emitter to a flow path of gas or liquid, a laser beam that crosses the flow direction of the gas or liquid, to selectively deflect the direction of movement of only the fine particles responsive to optical pressure in the direction of convergence of the laser beam, while adjusting the laser beam so as to converge inside each chamber of the collector facing each laser beam emitting aperture with the flow path interposing there between, thereby sorting the fine particles and recovering the fine particles in the chambers of the collector.

Claim 3 is allowable over the prior art of record because the teachings of the references taken as a whole do not show or render obvious the combination set forth, including: (1) a method for sorting and recovering fine particles that are responsive to optical pressure comprising; using an apparatus for recovering the fine particles

comprising a laser beam emitter that has two or more emitting apertures and a collector that has two or more chambers corresponding in number to the number of emitting apertures, irradiating with each laser beam from the laser beam emitter the target fine particles, which are responsive to optical pressure in a flow path of gas or liquid; a laser beam that crosses the flow direction of the gas or liquid, to selectively deflect the direction of movement of only the fine particles responsive to optical pressure in the direction of convergence of the laser beam, while adjusting the laser beam so as to converge inside each chamber of the collector facing each laser beam emitting aperture with the flow path interposing there between, thereby sorting the fine particles and recovering the fine particles in the chambers of the collector.

Claim 8 is allowable over the prior art of record because the teachings of the references taken as a whole do not show or render obvious the combination set forth, including: (1) an apparatus for recovering fine particles, comprising: a collector for collecting fine particles that are responsive to optical pressure; a laser beam emitter; and a flow path for flowing a gas or liquid, the collector having chambers corresponding in number to the emitting apertures, which are disposed so that the opening faces the flow path; the laser beam emitter having at least two emitting apertures; and the apparatus being configured so as to emit a laser beam from each emitting aperture toward the opening of each chamber of the collector in such a manner that the laser crossed the flow path and converges inside the opening.

Any comments considered necessary by applicant must be submitted no later than the payment of the issue fee and, to avoid processing delays, should preferably accompany the issue fee. Such submissions should be clearly labeled "Comments on Statement of Reasons for Allowance."
